BRIAN SIRCUS  
SUPERVISORY PATENT EXAMINER  
TECHNOLOGY CENTER 2800

The following is an examiner's statement of reasons for indicating allowance of claims 1 and 12: Kammer et al. [PN. 6392422] and Bilac et al. [PN. 4672501] teaches a method and device for monitoring insulation and fault current in an electrical alternating current network, the method comprises a sensing circuit, a comparison circuit, a fault discriminator to generate a fault identifying signal discriminating between a first class of fault and a second class of fault, and a trip signal generator to generate a trip signal, wherein when the fault identifying signal identifies that the fault condition is due to the second class of fault occurring, said fault discriminator generates a state indication signal discriminating between a second class of fault caused by a first state and a second state; the trip signal generator generates a trip signal when the state indication signal identifies that the fault indication is due to the second state occurring. However, the prior art does not disclose that the second condition is an increase in the resistance of a circuit comprising the power line. This feature in combination with the rest of the claim limitations is not anticipated or rendered obvious by the prior art of record.
